

Sky Calendar - November $2019 \begin{aligned} & \text { Get sky Calendar on Twitter } \\ & \text { http://twiter.com/skymaps }\end{aligned}$
Moon near Saturn (evening sky) at 8h UT. Mag. 0.6. Occ. Auckland, NZ.
4 First Quarter Moon at 10:22 UT.
Moon at apogee (farthest from Earth) at 9h UT (distance 405,058 km; angular size 29.5').
10 Venus $3.9^{\circ} \mathrm{N}$ of Antares ( $23^{\circ}$ from Sun, evening sky) a 1h UT. Mags. -3.9 and 1.0.
10 Mars $2.8^{\circ}$ NNE of Spica ( $24^{\circ}$ from Sun, morning sky) at 9h UT. Mags. 1.8 and 1.0.
11 Transit of Mercury across the Sun. WARNING: NEVER LOOK AT THE SUN - it will instantly damage your eyes. Observers require a safe Sun filter attached securely to the front of their telescope to safely observe Mercury's tiny disk pass in front of the Sun The event will be visible from most of Earth except central and eastern Asia, Japan, Indonesia and Australia. Transit begins at 12:35 UT; mid-transit at 15:20 UT; ends at 18:04 UT. The next transit of Mercury will occur on November 132032.
12 Full Moon at 13:36 UT.
3 Moon near the Pleiades (morning sky) at 11h UT.
17 Leonid meteor shower peaks at 23h UT. Arises from debris ejected by Comet Tempel-Tuttle. Produces very fast meteors ( $71 \mathrm{~km} / \mathrm{sec}$ ). Expect 10-15 meteors per hour under dark skies. Moonlight will interfere.
19 Last Quarter Moon at 21:12 UT.
23 Moon at perigee (closest to Earth) at 7:42 UT (366,716 km; angular size 32.6').
24 Venus $1.4^{\circ}$ S of Jupiter ( $26^{\circ}$ from Sun, evening sky) at 13h UT. Mags. -3.9 and -1.8.
26 New Moon at 15:07 UT. Start of lunation 1199.
28 Mercury at greatest elongation west ( $20^{\circ}$ from Sun, morning sky) at 10h UT. Mag. -0.5.
28 Moon, Venus and Jupiter within a circle of diameter $4.3^{\circ}\left(25^{\circ}\right.$ from Sun, evening sky) at 12h UT. Mags. -3.9 and -1.8 .
28 Moon near Venus ( $27^{\circ}$ from Sun, evening sky) at 20h UT. Mag. -3.9. 29 Moon near Saturn (evening sky) at 22h UT. Mag. 0.6.

## About the Celestial Objects

Listed on this page are several of the brighter, more interesting celestial objects visible in the evening sky this month (refer to the monthly sky map). The objects are grouped into three categories. Those that can be easily seen with the naked eye (that is, without optical aid), those easily seen with binoculars, and those requiring a telescope to be appreciated. Note, all of the objects (except single stars) will appear more impressive when viewed through a telescope or very large binoculars. They are grouped in this way to highlight objects that can be seen using the optical equipment that may be available to the star gazer.

## Tips for Observing the Night Sky

When observing the night sky, and in particular deep-sky objects such as star clusters, nebulae, and galaxies, it's always best to observe from a dark location. Avoid direct light from street lights and other sources. If possible observe from a dark location away from the light pollution that surrounds many of today's large cities.

You will see more stars after your eyes adapt to the darkness-usually about 10 to 20 minutes after you go outside. Also, if you need to use a torch to view the sky map, cover the light bulb with red cellophane. This will preserve your dark vision.

Finally, even though the Moon is one of the most stunning objects to view through a telescope, its light is so bright that it brightens the sky and makes many of the fainter objects very difficult to see. So try to observe the evening sky on moonless nights around either New Moon or Last Quarter.

## Astronomical Glossary

Conjunction - An alignment of two celestial bodies such that they present the least angular separation as viewed from Earth.
Constellation - A defined area of the sky containing a star pattern.
Diffuse Nebula - A cloud of gas illuminated by nearby stars.
Double Star - Two stars that appear close to each other in the sky; either linked by gravity so that they orbit each other (binary star) or lying at different distances from Earth (optical double). Apparent separation of stars is given in seconds of arc (").
Ecliptic - The path of the Sun's center on the celestial sphere as seen from Earth.
Elongation - The angular separation of two celestial bodies. For Mercury and Venus the greatest elongation occurs when they are at their most angular distance from the Sun as viewed from Earth.

Galaxy - A mass of up to several billion stars held together by gravity.
Globular Star Cluster - A ball-shaped group of several thousand old stars.
Light Year (ly) - The distance a beam of light travels at $300,000 \mathrm{~km} / \mathrm{sec}$ in one year. Magnitude - The brightness of a celestial object as it appears in the sky.
Open Star Cluster - A group of tens or hundreds of relatively young stars.
Opposition - When a celestial body is opposite the Sun in the sky.
Planetary Nebula - The remnants of a shell of gas blown off by a star.
Universal Time (UT) - A time system used by astronomers. Also known as Greenwich Mean Time. USA Eastern Standard Time (for example, New York) is 5 hours behind UT. Variable Star - A star that changes brightness over a period of time.

## Easily Seen with the Naked Eye

Altair
Capella $\delta$ Cephei Deneb $\alpha$ Herculis Vega Algol Fomalhaut Fomathaut Pleiades Hyades Aldebaran Polaris

- Brightest star in Aquila. Name means "the flying eagle" Dist=16.7
- The 6th brightest star. Appears yellowish in color. Spectroscopic binary. Dist=42 ly.
a Cepheid prototype. Mag varies between $3.5 \& 4.4$ over 5.366 days. Mag 6 companion.
- Brightest star in Cygnus. One of the greatest known supergiants. Dist=1,400 200 ly .
a Semi-regular variable. Magnitude varies between $3.1 \& 3.9$ over 90 days. Mag 5.4 companion.
- The 5th brightest star in the sky. A blue-white star. Dist=25.0 ly.
- Famous eclipsing binary star. Magnitude varies between $2.1 \& 3.4$ over 2.867 days.
- Brightest star in Piscis Austrinus. In Arabic the "fish's mouth". Dist=25 ly
- Brightest star in Piscis Austrinus. In Arabic the fish's mouth. Dist=25 ly. Large V-shaped star cluster. Binoculars reveal many more stars. Dist=152 ly.
- Brightest star in Taurus. It is not associated with the Hyades star cluster. Dist=66.7 ly.
- The North Pole Star. A telescope reveals an unrelated mag 8 companion star. Dist=433 ly.

## Easily Seen with Binoculars

M31
M2
The Andromeda Galaxy. Most distant object visible to naked eye. Dist=2.5 million ly

M38
M38
M36
M37
$\mu$ Cephei
${ }_{\text {Mira }}$
Mira
$\chi$ Cygni
M39

- Bright Cepheid variable. Mag varies between 3.6 \& 4.5 over 7.166 days. Dist=1,200 ly Stars appear arranged in "pi" or cross shape. Dist=4,300 ly. About half size of M38. Located in rich Milky Way star field. Dist=4,100 ly. Very fine star cluster. Discovered by Messier in 1764. Dist=4,400 ly.
- Herschel's Garnet Star. One of the reddest stars. Mag 3.4 to 5.1 over 730 days.
- Famous long period variable star. Mag varies between $3.0 \& 10.1$ over 332 days.
- Long period pulsating red giant. Magnitude varies between $3.3 \& 14.2$ over 407 days. May be visible to the naked eye under good conditions. Dist=900 ly.
- Wide pair of white stars. One of the finest binocular pairs in the sky. Dist=100 ly.
$\oplus$ Best globular in northern skies. Discovered by Halley in 1714. Dist=23,000 ly.
$\oplus \quad$ Fainter and smaller than M13. Use a telescope to resolve its stars.
- Famous Double Double. Binoculars show a double star. High power reveals each a double
- Semi-regular variable. Magnitude varies between $3.9 \& 5.0$ over 46.0 days. Large, scattered open cluster. Visible with binoculars. Scattered open cluster. Visible with binoculars.
$\oplus$ Only globular known to contain a planetary nebula (Mag 14, d=1"). Dist=30,000 ly Double Cluster in Perseus. NGC 869 \& 884. Excellent in binoculars. Dist=7,300 ly. Bright cluster located about 6 deg $N$ of "teapot's" lid. Dist=1,900 ly.
0 Fine, large, cigar-shaped galaxy. Requires dark sky. Member of Sculptor Group.
- Good eyesight or binoculars reveals 2 stars. Not a binary. Mizar has a mag 4 companion. Coathanger asterism or "Brocchi's Cluster". Not a true star cluster. Dist=218 to 1,140 ly.

## Telescopic Objects

M81 M81 M82
M27

- Attractive double star. Bright orange star with mag 5 blue companion. Sep=9.8" क. Saturn Nebula. Requires 8 -inch telescope to see Saturn-like appendages.
क. Hetix Nebula. Spans nearly $1 / 4$ deg. Requires dark sky. Dist=300 ly.
- Impressive looking double blue-white star. Visible in a small telescope. Sep=7.8"
- Yellow star mag 3.4 \& orange star mag 7.5. Dist=19 ly. Orbit=480 years. Sep=12".
- Beautiful double star. Contrasting colours of orange and blue-green. Sep=34.4".
- Attractive double star. Mags 5.2 \& 6.1 orange dwarfs. Dist=11.4 ly. Sep=28.4".
- Appear yellow \& white. Mags 4.3 \& 5.2. Dist=100 ly. Struve 2725 double in same field. a Eclipsing binary. Mag varies between 3.3 \& 4.3 over 12.940 days. Fainter mag 7.2 blue star
* Ring Nebula. Magnificent object. Smoke-ring shape. Dist=4,100 ly.
- Omega Nebula. Contains the star cluster NGC 6618. Dist=4,900 ly. Wild Duck Cluster. Resembles a globular through binoculars. V-shaped. Dist=5,600 ly.
- Eagle Nebula. Requires a telescope of large aperture. Dist=8,150 ly.
- Crab Nebula. Remnant from supernova which was visible in 1054. Dist=6,500 ly.

0 Fine face-on spiral galaxy. Requires a large aperture telescope. Dist=2.3 million ly.
0 Beautiful spiral galaxy visible with binoculars. Easy to see in a telescope.

- Close to M81 but much fainter and smaller.
$\$$ Dumbbell Nebula. Large, twin-lobed shape. Most spectacular planetary. Dist=975 ly
